# FMEA – Risk Analysis and Management

Identifying risks and initiating mitigating actions early to reduce their probability or severity is a core responsibility of management and must be part of each larger project.
Industry standard of risk analysis is the FMEA method (**Failure Mode and Effects Analysis**), which we offer as a software tool complemented by execution support. Trainings on risk analysis as well as facilitation of project workshops and coaching are part of our proposal. By using our software-application a valuable knowledge pool is being created for your company.

## 1. Training of teams

Our base offering is the following package:

- Training with eight participants (12 persons max)

- **Standard Training**: 4,5 hours
  **Price 1.600 Euro** + travel and VAT

- **Extended Training**: 7 hours
  incl. start of your individual project-FMEA
  **Price 1.950 Euro**  + travel and VAT

Training content:

- Method and requirements
- Three risk factors in detail
- Use cases / examples
- [Extended: start your own risk assessments]
- Action planning and implementation
- Software application
- Result presentation and communication

## 2. Facilitation of workshop and leadership coaching

**Risk analysis carries a high risk of conflict.** Often responsibilities are pushed from one group to another and the objective to specify risk factors and develop mitigating actions is lost by accusations in the process. We support you by facilitating risk mgmt. workshops focused on FMEA and action plan development.

This is complemented by coaching your project managers and leaders for those projects and specifically dealing with the various communication challenges.
**Our offer will be tailored to your specific situation and needs.**

## 3. Software & Knowledge Pool

Part of our **SixSigma Toolbox** are specific modules for FMEA and risk analysis for single processes. We offer the application with all available tools **from 43€ / month** (+ VAT). Using it for your projects builds up instantly a valuable knowledge pool. The software is (private-) cloud-based and immediately deployable across your enterprise. If required, it can easily be individualized and enhanced.

**With this you can manage the risks of your projects and processes – driving result and ready to be audited anytime.**
